

Sea-R.O., Inc. Brackish water desalinators are designed to produce excellent quality water from a well or surface water source with existing dissolved solids up to 10,000 ppm.

designed for easy installation and requiring a minimum amount of space, these affordable units will make a world of difference in the taste and even the "feel" of your water.

Imagine crystal clear ice cubes, great tasting coffee, spot free water without scale build-up in your plumbing, and a safer, healthier supply of pure drinking water for you and your family.

Everything works better with quality water. Laundry, dishwashers, icemakers, hot water heaters all will all give superior performance with the water made from these units. Plus, you will use less detergent, soap, and shampoo.

Brackish water sources should always be properly tested prior to the installation of these systems. Generally, the systems can be used without any additional pre-treating, but a water sample and test are your insurance that this is the correct system for your application. Sea-RO can provide the proper test kit for this purpose.

If your source is subject to seasonal variations due to rainfall and/or demand, the test must be done under "worst case" conditions. This will enable Sea-RO to provide the correct system that will work in all possible conditions.

Consult the specification sheet for additional details in system selection.
