

Sea-R.O., Inc. Watermakers The Ideal Is and System RO unit, Storage Tank & Re-pressurization system

Sea-R.O. "Ideal Is and System" includes the reverse osmosis desalinator, a 300 gallon polyethylene storage tank and a re-pressurization pump with accumulator tank system.

Through a simple float level system, the desalinator is switched on automatically whenever the tank level drops below one half. Desalinator then fills tank and is shut off automatically.

Inside your home, a turn of the spigot will provide pure, healthy, great tasting water.

These systems are a quantum leap forward in desalinator design and makes making water easier than ever before.

These systems are available for operation on light brackish, brackish, or direct seawater sources. Storage tanks are available in a variety of sizes and shapes. Pressure system can also be provided in higher capacities for larger homes or facilities.

For informational purposes, see specification sheet for some common systems. Contact Sea-R.O., Inc. For a free technical proposal and price quote for your specific property or project.
