

Sea-R.O., Inc. Watermakers Media Filtration Systems

Sea-R.O., Inc. Media filtration systems are designed to provide filtration of the raw water source prior to any cartridge filters used within the desalination system.

Media filter systems extend the life of the cartridge filters by 10 times or more. Reducing filter cartridge costs and desalination system downtime.

Ruggedly made and very simple to operate and maintain. These filters are sized by the required feed flow rate to the desalinator. A proper boost and backwash pump is also required. Standard filters include all gauges and control valves for normal use and backwashing.

Filters include 5 layer multi-media filtration pack and complete installation and operation manual.

These filters can be easily added to existing systems. Consult with Sea-RO for proper sizing and to insure existing boost pump is appropriate.

Media filters are a benefit to the operation of any system but are an absolute necessity for land based units or marine systems used in the northeast and coastal areas of Maine or the Pacific Northwest where river runoff and plankton blooms create a heavy load on filter cartridges.
